Pulsation Control Products

Stainless Steel
Positive Displacement (PD) pumps create pulsation and hydraulic shock due to the reciprocating nature of their stroking action, potentially damaging the entire pumping system. Pulsation Dampeners remove hydraulic shock and reduce the pressure and flow fluctuations. This enhances the all-around performance and reliability of fluid handling equipment in industrial, chemical transfer, and precision metering applications.

Increase productivity, safety, reliability and efficiency.
Decrease maintenance and operating costs.

Fluid Energy Controls’ pulsation dampeners are designed to minimize pressure pulses generated by positive displacement pumps. The dampeners are built to withstand high pressure as they smooth out the harmful pressure pulses originating from the pump. They are especially suitable for water and petrochemical applications.

Features:

■ Flexible bladder design effectively reduces pump pulsations, vibrations and noises
■ No poppet and spring to restrict flow of viscous process liquids.
■ Designed and stamped per ASME Section VIII, Div. I, European CE, Canadian CRN, Brazilian NR-13, Chinese SELO, and Malaysian DOSH certifications also available
■ Buna-N bladder with integral anti-extrusion button for long life. Viton and other compounds available
■ All wetted parts are stainless steel
■ Prolongs service life of pumps, valves, instruments, and pipe joints

**Stainless Steel Pulsation Dampeners**

Fluid Energy Controls 316 Stainless Steel Pulsation Dampener is specifically designed to satisfy the needs of petrochemical, reverse osmosis and water processing industries. It can effectively dampen the damaging pulsations caused by the reciprocating pumps. This reduces the possibility of costly damage to pipelines, instrumentation, loosened pipe fittings, leakage and downtime.

**Features:**
- Significantly reduces pump pulsations
- Reduces pump vibration and noise
- Increases pump service life; reduces wear and fatigue on pump’s internal parts
- Repairable in the field
- All wetted parts are of 316 series stainless steel for protection against corrosion

**Specifications:**
- Volume — 60 cubic inches
- Maximum working pressure — 1,500 PSI
- Operating temperature range — -20°F to +185°F
- Diameter — 4.5 inches
- Length — 11 inches
- Port — 1” NPT (female)
- Weight — 10 lbs.

**Installation, operation and maintenance are simple...**

**Installation** — Install the dampener as close as possible to the discharge port of the pump.

**Operation**
- Precharge dampener with dry Nitrogen to approximately 70% of the system operating pressure.
- Check the precharge pressure periodically.

**Pre-Charge Monitor Schedule**

The Accumulators, Surge Suppressors and Pulsation dampeners shipped from the factory of Fluid Energy Controls are only pre-charged to 20 psi with dry Nitrogen gas. This pre-charge protects the bladders from getting damaged during shipping. After installation of the unit, the bladder inside the unit needs to be properly pre-charged with dry Nitrogen gas to 70-80% of the working pressure of the pipeline. The pre-charging is accomplished before the fluid starts pumping in the pipeline.

For newly installed units, the pre-charge should be monitored every two weeks. There should be no fluid pumping through the pipeline during this process. If the pre-charge has dropped, then more Nitrogen gas should be pumped into the bladder to raise the pre-charge in the bladder to the recommended pressure. When there is no loss of pre-charge noticed, the pre-charge should be monitored every four weeks.

Caution: Do not use Oxygen or air to pre-charge the bladder. Use only Nitrogen for pre-charging.
